Item 8.01 Other Events.

On August 14, 2013, Ampio announced results from the Company s SPRING study of Ampion for the treatment of osteoarthritis of the knee. The SPRING study, was a randomized (1:1:1:1), double-blind, vehicle controlled trial designed to evaluate the safety and efficacy of Ampion in osteoarthritis of the knee patients. Patients were randomized to receive one of two doses (4 mL or 10 mL) of Ampion or corresponding saline control via intra-articular injection. The primary study objective was to evaluate the relative efficacy of Ampion 4 mL versus Ampion 10 mL. The primary endpoint was mean change in pain from baseline for Ampion compared to the same volume of saline. Secondary endpoints included evaluating safety and quality of life, as well as, stiffness and function. Ampion dose cohorts experienced statistically significant reductions in pain compared to control. There were no significant differences between the efficacy of the two Ampion doses. Selection of the optimal dose for the second Phase 3 trial will be decided in consultation with the U.S. Food and Drug Administration (FDA).
